Read the passage and answer the questions that follow.

The term "herd behaviour" comes from the behaviour of animals in herds, particularly when they are in a dangerous situation such as escaping a predator. All of the animals band closely together in a group and, in panic mode, move together as a unit. It is very unusual for a member of the herd to stray from the movement of the unit.

The term also applies to human behaviour, and it usually describes large numbers of people acting in the same way at the same time. It often has a connotation of irrationality, as people's actions are driven by emotion rather than by thinking through a situation. Human herd behaviour can be observed at large-scale demonstrations, riots, strikes, religious gatherings, sports events and outbreaks of mob violence. When herd behaviour sets in, an individual person's judgment and opinion-forming process shut down as he or she automatically follows the group's movement and behaviour.

Herd behaviour in humans is frequently observed at times of danger and panic; for example, a fire in a building often causes herd behaviour, with people often suspending their individual reasoning and fleeing together in a pack. People in a crisis that requires escape will attempt to move faster than normal, copy the actions of others, interact physically with each other and ignore alternative strategies in favour of following the mass escape trend.

A more obvious example of human herd behaviour occurs in dense public crowds or mobs. Crowds that gather because of a grievance or protest can involve herding behaviour that becomes violent. Psychologists posit that a "group mind" can overtake a mob and embolden people to act in ways they would not individually, increasing the likelihood that situations become violent.

Sporting events can also create herd behaviour on a violent scale. The football hooliganism prevalent in Europe in the 1980s is a well-known example of sports-related herding behaviour and violence. Overzealous fans of football teams often engaged in unruly or destructive behaviour in the name of supporting their team and intimidating the rival team, to the extent that people involved could be badly injured or even killed.

Some historians believe that Adolf Hitler purposefully took advantage of herd behaviour psychology by planting a significant number of undercover German officers in the crowds at his speeches. These officers would enthusiastically cheer for Hitler, and the rest of the crowd followed suit, making it seem as if the entire crowd supported Hitler. These speeches would then be broadcast to a larger public audience, magnifying the effect.

Herd behaviour does not always have such harmful effects; it can be influential in people's every day, simple decisions. For example, suppose that a family is walking down the street looking for a restaurant to have dinner. If they pass a restaurant that is empty and one that is relatively crowded with patrons, they are far more likely to choose the crowded one, on the assumption that it's better because there are more people there. Herding can be subtle in this way; it simply involves people's tendency to follow a crowd rather than carve out an individual path in many situations.

Read the passage and answer the questions that follow.

An online identity, sometimes called an Internet persona, is an identity established by a user to interact with others through social media such as Facebook, Twitter, blogs, or multi-player games. Although some people use their real names online, many Internet users prefer to be anonymous, identifying themselves by pseudonyms. Some users can be deceptive about their identity.

Users express online identity both explicitly and implicitly. Users express themselves explicitly through usernames, pictures, and the information about themselves that they choose to give others, such as their hometown. They can also explicitly express their identity by choosing an avatar, an iconsized graphic image, or by creating user profiles in social media networks, such as Facebook. Implicitly, users express their identity through what they say to other users and the opinions they express. As other users interact with an established online identity, it gains a reputation, which enables them to decide whether the identity is worthy of trust.

Social networking services and online avatars have made the notion of identity far more complex, because the identities that people define in the social media are not necessarily the identities that they actually have. For example, several studies have shown that people lie about themselves in online dating profiles, or in communication with potential partners. A person may feel that she is able to lie about her identity on the Internet because it creates a "mask" effect, where no one can see her "true self." Social theorists believe that whenever an individual interacts with others online, she portrays a mask of her identity, not her true identity.

This is partly due to the fact that in some online contexts, such as Facebook, she must answer specific questions to create an online profile. Further, as she begins to interact with others, she adds more and more layers to her mask through the vocabulary she uses and the topics she writes about. The kind of mask one chooses, reveals at least something about the person who chooses it. While the online mask does not reveal the actual identity of the person, it does reveal an example of what lies behind the mask. For instance, if a person chooses to act like a rock star online, this may mean that he or she has an interest in rock music. Even a person choosing to hide behind a totally false identity says something about the fear and lack of self-esteem he or she may be experiencing.

Online identity offers potential social benefits to those with physical and sensory disabilities, because others cannot see them. These users can free themselves from their disabilities by creating online

personas that are not disabled. This is called "disembodiment," and gives these users the opportunity to operate outside the constraints of social stigmatisation. They can be treated on their merits as a person, rather than being seen as someone inferior due to a disability. Most concerns about virtual identity revolve around the contrast between online and offline existence. The ability to challenge the notion of what "real" means has raised questions about how virtual experience may affect one's offline emotions.
